

ABSTRACT OF THE DISCLOSURE

A cup for dispensing liquid and solid medication. The cup has a bottom 12, two sides 14, 16, extending upwardly from the bottom to form a rim 26 at a top of the cup, and a ramp 18 extending outwardly from the bottom 12 at least part way to the rim. The two sides and the ramp 19 join to form a mouthpiece of the cup. An upper vertical portion 24 extends downward from the rim 26. The ramp 19 extends outwardly from the bottom 12 to the upper vertical portion 24 such that the two sides 14, 16, the ramp 19, and the upper vertical portion 24 join to form a mouth piece of the cup. The cup allows an individual to consume the entire contents within the cup without moving the head or neck backwards.
